

There are three teacher planning documents.

1. **Scope and Sequence:** Plans the entire year's pace and breaks state standards into groups, these become thematic units for the teacher. (Scope and sequences are provided by a district, but in smaller schools, they can be built by teacher teams)
2. **Weekly Lesson Plan:** outlines the week's objectives and provides an explanation of how exactly standards are taught and assessed. (teacher created)
3. **Daily Lesson Plan:** A weekly lesson plan is made up of 4- 5 daily lesson plans (teacher generated). Discusses what is being taught and how on a given day.

What a teacher needs on a daily basis that we want to deliver:

Our App must deliver (At all levels):

- A weekly lesson plan with up to five daily lesson plans.
 - Materials for a lesson that are Accommodated and/or Modified. Choosing the materials should automatically populate the information for the lesson plans.
-

Our App should also eventually deliver:

- Guided Notes that students can receive and fill using a presentation.
- A presentation for the topic.

What our app needs to deliver for school districts (Enterprise Level).

The ability to scan and send documents that can be sent to support staff,

The ability to select whether a student succeeded at a task or not. This is not a grade and is meant to be a cumulative process by which a student's actions over time start aligning him or her with college and non-college careers as well as a text number to contact regarding them.

On our end, this requires a process to peer review outbound messages as well as a way for districts to have instantaneous access to every message exchanged.

We would also like to see a process develop in which artificial intelligence begins to identify common questions and providing automated responses.

Examples:

Is engineering school hard? How hard is an engineering school?

These would trigger the same answer.

Lastly, when you read the messages in this folder go in numerical order from message number 1 to message number 4. After this page break, you will find a more detailed explanation that was provided at an earlier time. Please also read that before tearing into the rest of this folder's contents.

Here is the Project Description:

Part 1:

Create app that allows teachers to select and gather daily work assignments for students.

Each assignment will have a regular and modified version.

Teachers should be able to select up to 6 daily assignments each week.

Selected assignments being documents will have custom metadata properties attached.

The app will need to be able to pull the metadata for each assignment.

Pulling the metadata properties and placing them in a single document will create a weekly lesson plan.

Part 2:

Include a pdf scanner type function that will scan a printed work assignment that a student has completed and will email it to anyone the teacher needs to email it to. (If there's an easier way, go for it)

When a teacher scans the document they can click whether or not a student successfully worked on it. This action generates a report from all classes in which we can provide some career suggestions based on actual in school performance.

There will be a text message based interaction with a audio or video recorded person. As we gather common questions and responses that will become more of a bot interaction overtime.

Part 3:

The app will need to generate each student a code. Each assignment will have its own code. The student code and assignment code will be entered by students allowing them to access a copy of the assignment and also a read aloud audio file.

The vision is for teachers to create massive amounts of content and be reimbursed via a Spotify business model.
