

LYS Feature Audit — Everything the App Does, and What Needs Attention

Date: July 15, 2026 **How to read this:** Part 1 is the full inventory of what the app does today. Part 2 lists the gaps we found — things that are limited, incomplete, or not yet ready — in priority order. Part 3 splits that work into "developer only" vs. "any team member can do this."

This audit deliberately **excludes** items already sitting in the project task list and the risks already written up in `threat_model.md` — those are tracked elsewhere. Everything below is either working functionality or a *newly identified* gap.

Part 1 — Full Feature Inventory

A. Getting in the door (visitors, sign-up, login)

Feature	What it does	Status	Recommended Fixes
Public landing page	Visitors see a marketing page tailored to who they are (student, teacher, school) before logging in	Working	Fixed
Sign in / sign up (Clerk)	Email, Google, and other login options; under-13s blocked from self sign-up (COPPA)	Working	
Enterprise single sign-on (SSO)	Schools can log in through Google, Azure, Okta, or a generic provider; new accounts auto-created by email domain	Working	
Two-factor security (MFA)	Authenticator-app codes required for admins before sensitive actions; recovery codes supported	Working	

Free trial	10-day Pro trial, with tracking to prevent people from taking repeat trials	Working	
Guest lesson generation	Visitors can generate up to 5 lessons/month after giving an email; lessons transfer to their account if they sign up	Working	
Onboarding wizard	New users pick their role, interests, and needs in a few steps	Working	Between the public landing page and the signup process, each user type needs to see the functions or features that are most valuable to them. E.g. students may want to focus more on scholarships and resources like that. I think we should look at ways to better blend the needs analyzer with the sign-up process to reduce redundancy and improve the process. I also noted that homeschool parents are asked to setup a lessons by their child's interests which is cool, however, if they do 5 days a week, then it takes away all their free lessons for the month. I think it should be limited to 3 days worth of lessons so that they can get their first

success on the app.

One of the main things I don't like about the student practice area, is that doesn't add value. Scrap it. Let's focus on Be, Know, Do or scholarship resources for students.

When any user type onboards, we want to localize their use of the system by showing the most relevant things to their geographic location. A few examples are students seeing scholarships that are in their country as a priority, educators seeing resources in their community library that are uploaded or created by teachers in their country, and schools and campus admins being able to access resources that are most relevant to them, then prioritized by closest to furthest. So that they feel that the system belongs to them. So we should adjust the onboarding wizard for each user to include

			thier country, state/region, and city during this segment of the signup process so that this geolocation is possible.
--	--	--	---

B. AI teaching tools (the core product)

Feature	What it does	Status	Recommended Fixes
AI Lesson Generator	Creates full lesson plans from a topic + academic standards, with a live 5-phase progress screen	Working	
AI Assignment Generator	Creates quizzes, worksheets, and projects to go with lessons	Working	All quizzes, worksheets, projects, etc should be able to create a grade with each completion
Student Practice Generator	Students (or guests) generate practice work at <code>/practice</code>	Working	
Essay Builder	AI-assisted college/personal essay drafting	Working	
Homeschool Weekly Planner	Builds a week of homeschool plans at <code>/homeschool</code>	Working	
Content safety	Student names and personal info are stripped out before anything is sent to the AI; sensitive topics filtered; flagged content goes to a review queue	Working	

AI quality "voice" system	Generated lessons are scored against master-teacher writing; weak output gets rewritten automatically	Working (behind an off-by-default switch for the retrieval part)	
AI outage safety net	If OpenAI is down, the app falls back to cached/example content instead of crashing	Working — but see gap #3 below	

C. Academic standards

Feature	What it does	Status
Standards catalog	Browse standards by country → state → subject → course → grade	Working
Official standards sync	Pulls real published standards from the Common Standards Project	Working
PDF/document ingestion	Admins can upload a standards PDF and the AI extracts the standards from it	Working; flags itself for review if it thinks it missed some
Texas Agriculture (TEKS)	Principles of AFNR course fully ingested	Working
International fallback	Countries with no synced standards fall back to a built-in list, clearly labeled	Working
Coverage widgets	Teachers see which standards they've used and which are still uncovered	Working

D. Student experience (Be–Know–Do)

Feature	What it does	Status	Recommended Fixes
Self-Discovery assessment	Students answer questions and get a strengths/interests profile	Working	

Strengths Inventory	Detailed personal strengths breakdown	Working	
Career Explorer	~830 careers with salary data, filters, and save-for-later	Working	
Scholarship Planner	Students track scholarship applications and requirements	Working	
Automated scholarship scraper	The system scrapes scholarship listings; admins approve them before students see them	Working — but see gap #2 below	Upgrade this to a standard Ai that the rest of the app uses so that everything updates together.
Mentor Connect	Connects students with mentors	Working	
Action Plans & Milestones	Goal-setting and progress tracking	Working	
Digital Portfolio	Students build a portfolio with a shareable public link; portfolios can transfer between schools	Working	There needs to be the ability to add their school work, upload images, I think to save space, maybe best for them to add links vs upload things. But also, I am not sure if the login to Handshake and LinkedIn work here.
Campus Activities	Browse and register for extracurriculars	Working	
Assignments page	Students view and submit assigned work	Working	

E. Classroom & school management

Feature	What it does	Status	Recommended Fixes
Classroom / rosters	Teachers manage classes and student lists	Working	Teachers should be able to mark students as absent, present or tardy
Gradebook	Grade tracking with a protected export (owner-or-admin only, rate-limited, audited)	Working	Teachers should be able to click on a student's name on the gradebook to get an individualized look at that students assignment responses and teachers should be able to make notes about students in gradebook. Because this app is to be used internationally, there should be a function where the top 10 most used grading systems/styles/scales are able to be selected for grading purposes. Examples including A-F grading systems. Points systems, ect. Also, For example, in Texas Other grades are 15% of your grade, minor grades are 35% of your grade, and major grades are 50% of your grade. Teachers should have the capability to change percentage amounts. Ask any questions needed for clarity in regards to this request. The LYS app should also be able to upload

			grades from LYS gradebook to a skyward, a frontline or any other attendance/gradebook used in most school districts internationally. Let me know if you run into any issues regarding this. Anytime a teacher creates any type of assignment, there should be an option to make the grade a major, minor or other grade. This should follow the flow created previously about using top 10 grading models internationally. Ask any questions for clarity.
Curriculum Planning	Year-at-a-glance and scope & sequence builders	Working	
Lesson Authoring	Manual lesson creation and a shared lesson library	Working	
Parent Portal	Parents see student progress, message teachers, and manage consents	Working — see gap #9	
SIS sync (Clever)	Pulls rosters from Clever	Working	
SIS sync (others)	PowerSchool, Canvas, Infinite Campus, Skyward	Not built — shown as "Coming Soon" in the app; see gap #6	
Org hierarchy	School → District → Charter Network, with invite codes and cascading settings	Working	I have a recommendation for fixing this. The correct hierarchy is District or

			Charter Network → School or Campus → Educator with invite codes and cascading settings
--	--	--	--

F. Money (subscriptions & billing)

Feature	What it does	Status
Stripe subscriptions	Pro (\$7.99/mo) and Campus tiers via card checkout	Working
Bank (ACH) payments	Bank checkout with "processing" / "cleared" / "failed" emails at every step	Working (just shipped)
Purchase orders	Districts upload a PO; admins mark it paid to activate seats	Working
PayPal	Alternate checkout path	Working — worth a periodic live test
Marketplace / affiliate program	Rewardful / PartnerStack / Stripe Connect integrations	Demo mode only — see gap #4

G. Administration & compliance

Feature	What it does	Status
Admin dashboards	Campus, District, and System admin pages with user management	Working
Role system	8-level role hierarchy enforced on the server	Working
Impersonation	Admins can act as a user (MFA-protected, audited)	Working
Audit trail	Tamper-evident log of every sensitive action, with a verification endpoint	Working

Privacy requests (GDPR/CCPA)	Data export and account erasure, with school records anonymized instead of deleted	Working
Data retention purge	Daily job deletes accounts past the 3-year retention date	Working (the trigger that sets the date is a known tracked item)
Standards ingestion admin	Upload, review, and approve ingested standards	Working
Content moderation queue	Flagged AI content awaits human review	Working — UI is basic; see gap #10

H. Team Hub (internal HR & operations) This is for LYS Staff only

Feature	What it does	Status	Recommended Fixes
Role directory	38 internal job roles with KPIs and SOPs, editable by admins	Working	We need a way to add, delete, edit roles. Auto suggest KPI's, SOP's, ect. Specific to the role
Staff access gate	Joining Team Hub requires admin approval (MFA-protected)	Working	This should not be seen by anyone until access is granted. So it may be once they signup, there can be a way that they get admins attention in the setting of their account
Onboarding tasks	Task checklists for new employees	Working	This should be more robust. When staff submit their answers, the

			system admin should be able to see them. So let's improve the way staff fill these in.
Quarterly OKRs module	Company goal tracking	Placeholder only — see gap #11	
Board and Calendar	Company goal tracking		1. Staff members should be able to add deadlines to their Google Calendar. 2. The staff calendar should have 3 views (my calendar, team calendar, all calendar) 3. System Admin and Executive staff should be able to set calendars geographically for their teams. Ex: a Manager in Nigeria should be able to adjust their calendar to thier school year so that the

team there has a different look than a team in germany or the US.

4. The calendars should be able to “sync” so that when a person in the hierarchy makes a change, it’s seen by everyone on that team.

1. The Kanban Board (Your Digital Sticky-Note Board)

A **Kanban board** is just a fancy name for a visual task tracker. Think of it like a board with columns, where you move sticky notes from left to right as you get stuff done.

Here are the main parts:

- **Lists (The Columns)**
: These represent different stages of your project. A

classic
setup
looks like
this:

- **To Do**
:
St
uff
yo
u
ha
ve
n't
sta
rte
d
yet
.
- **Do in g:**
St
uff
yo
u
ar
e
wo
rki
ng
on
rig
ht
no
w.
- **Do ne**
:
St
uff
yo
u
fini
sh
ed
(th
e
be
st
col
um

n!)

- **Cards (The Sticky Notes):**
Every task gets its own card. For example, if you're working on a science project, one card might say *"Research volcano types"* and another might say *"Buy poster board."*
- **Drag-and-Drop:** As soon as you start researching, you drag the *"Research volcano types"* card from **To Do** over to **Doing**. When you're finished, you slide it over to **Done**. It is super satisfying to move them!

**Cool Extras
Inside Each
Card:**

When you click on a card, it opens up like a mini notebook page where you can add:

- **Checklists:** Break a big task into smaller steps (like mini-quests).
- **Color Labels:** Tag cards with colors (e.g., Red for *Urgent*, Blue for *Math*, Green for *English*).
- **Attachments:** Drop in links, images, or documents you need for that task.
- **Comments:** Chat with classmates if you're working on a group project together.

**2. The
Calendar
Feature (Your
Time Machine)**

While the Kanban board shows *what* state your work is in, the **Calendar View** shows *when* things need to happen.

If you give your cards due dates, you can flip a switch and turn your whole board into a monthly or weekly calendar.

Here is what you can do with it:

- **See All Your Deadlines at a Glance:** Instead of columns, you see a regular monthly grid with your cards sitting on the exact days they are due.
- **Drag-and-Drop Rescheduling:** Just click the card on the calendar and drag it over to Friday. The due date updates automatically!
- **Avoid Last-Minu**

te Panic:

By looking at the week ahead, you can quickly spot if you have three big things due on the same day, so you know to start earlier.

When working in a group project or with a whole team can get a little chaotic. We need to avoid where one person did all the work while someone else forgot what they were supposed to do.

1. Add a "Workload Meter" (Fair Work Sharing)

- **The Problem:** Right now, it's easy for one person on the team to end up with 10 giant tasks assigned to them while someone else only

has 1 tiny task.

- **The Fix:** A built-in workload tracker. It could show a little gauge next to each teammate's picture (Green = *Good*, Red = *Overloaded!*). That way, the team leader can instantly see who needs help and redistribute the work fairly before anyone burns out.

2. Smart "Domino Effect" Dates (Task Dependencies)

- **The Problem:** In team projects, tasks often rely on each other. You can't edit a video until someone finishes filming it! If the filmer is late, the editor's

deadline gets messed up, too.

- **The Fix:** Connect cards like falling dominoes. If the "Film Video" card gets delayed by 2 days, it should automatically move the "Edit Video" card back by 2 days, too. That way, nobody has to manually fix 20 different dates on the calendar.

**3. Built-In
Stopwatches
(Time
Tracking)**

- **The Problem:** Teams usually guess how long a task will take, and they are usually wrong. Right now, Trello doesn't show if a card took

15 minutes or 15 hours unless you add third-party apps.

- **The Fix:**
Put a simple timer button directly on every card. Teammates could hit "Start" when they begin working and "Stop" when they take a break. This helps the team learn how long tasks *actually* take so they can plan better next time.

4. An In-Board Team Chat (Fewer Apps to Check)

- **The Problem:**
You can leave comments on individual cards, but if you just want to talk to your team

in general (like *"Hey guys, should we meet at lunch?"*), you have to switch to Discord, text, or email.

- **The Fix:**
Add a main chat tab right on the side of the board. Keeping all the general group talk in the exact same place where the work lives stops important news from getting lost.

5. Automatic "Board Housekeep ing" (Anti-Clutt er)

- **The Problem:**
When 5 or 10 people use the same

board, it can quickly look like a messy bedroom. People forget to move finished cards, forget to add due dates, or leave old draft cards sitting around forever.

- **The Fix:** Smart cleanup rules built into the board. Trello could automatically warn someone if a card has been sitting in "Doing" for two weeks, or sweep old, finished cards into an archive box every Friday to keep the board sparkling clean.

The Kanban and calendar should have executive summary

			features where a high level team leader can give the gist of a task for all to see and also how it ties to their OKR's.
--	--	--	---

I. Growth & integrations

Feature	What it does	Status
HubSpot sync	Users and companies sync to the CRM	Working
School demo requests	"For Schools" page with a demo-request form	Working
Embeds & WordPress plugin	LYS tools can be embedded in outside websites	Working
Career data refresh	Scheduled pull from the Bureau of Labor Statistics + RSS ingestion	Working
Admin email digests	Scheduled summary emails to admins	Working
Command palette (Ctrl+K)	Jump anywhere in the app	Working
Dark mode, personas, role-based navigation	The app reshapes itself by who you are	Working

Part 2 — Gaps Found, in Priority Order

Priority is a blend of: paying-customer impact, student/teacher experience, and risk. **#1 is most urgent.** (Items already in the project task list or threat model are not repeated here.)

#	Gap	Why it matters	Where
1	Affiliate integrations quietly pretend to work. When Rewardful/PartnerStack/Stripe Connect aren't configured, the system reports "success" with a fake ID instead of an error.	Anyone relying on affiliate payouts could believe partners are being tracked when nothing is happening. Silent money-related failure.	<code>server/services/affiliateIntegrations.ts</code>
2	Scholarship scraper uses a hardcoded AI model name (<code>gpt-5-mini</code>). If that model name is retired or wrong for the environment, scraping fails.	Students stop getting new scholarships and nobody is alerted.	<code>server/scholarshipScraper/scraper.ts</code>
3	The "AI is down" fallback can serve a low-quality mock template if the OpenAI keys are ever missing/misconfigured, with no loud alarm.	Paying teachers could receive obviously bad lessons and blame the product.	<code>server/services/fallbackResolver.ts</code> , <code>server/openai.ts</code>
4	Payments code still carries "Demo Mode" notes. Stripe/PayPal paths have leftover notes saying full environment configuration is needed to be live. Live checkout works, but the notes make it hard to know which paths are production-ready.	Revenue path clarity — a future change could accidentally flip a demo behavior on.	<code>server/routes/payments.ts</code>

5	AI embeddings can silently switch off. A global "disabled" flag flips if embeddings fail once, and the smart-retrieval quality features quietly stop until restart.	Lesson quality silently degrades with no visible sign.	<code>server/services/embeddingService.ts</code>
6	Four SIS providers are visible but fake. PowerSchool, Canvas, Infinite Campus, and Skyward appear in the integrations screen as "Coming Soon"; the server errors if tried.	Schools evaluating LYS may count on these. Decide: build, or remove from the UI until real.	<code>client/src/pages/SISIntegration.tsx,</code> <code>server/services/sisService.ts</code>
7	"Not yet verified by LYS" labels on Be-Know-Do alignments. Unverified curriculum alignments show this hardcoded label to users.	Teachers see an unfinished-feeling trust label on a flagship framework. Needs a verification workflow or better wording.	<code>server/lib/bkdAlignment.ts</code>
8	Post-secondary grade levels say "Coming Soon" in the Lesson Generator.	Limits the addressable audience; also sets expectations we should either meet or remove.	<code>client/src/pages/LessonGenerator.tsx</code>
9	Parent Portal messaging is richer in the UI than on the server. Some relationship checks between parent and student records are	Family-facing feature; should be verified end-to-end before heavy promotion.	<code>client/src/pages/ParentPortal.tsx</code> + related routes

	thinner than the UI implies.		
10	Content moderation review queue is minimal. Flagged content goes to a queue, but the admin review screen is basic and marked for expansion.	Safety workflow bottleneck as usage grows.	<code>/api/admin/resource-reports</code> + admin UI
11	Team Hub "Quarterly OKRs" is an empty placeholder ("HR will populate...").	Internal only, but looks unfinished to staff. Fill it in or hide it.	<code>server/seedFoundation.ts</code>
12	Matriculation (school-transfer history) has a backend but no student-facing screen.	Half-built feature; finish or park it deliberately.	<code>/api/admin/matriculation</code>
13	Analytics are digest-emails, not dashboards. Standards-observability reports arrive by scheduled email; there's no live dashboard.	Fine for now; worth knowing it's a limitation when selling to districts.	analytics routes + digest jobs

Part 3 — Who Should Do What

Developer-only (touches protected areas: server code, payments, integrations, security)

In priority order:

1. **#1 Affiliate demo-mode silent success** — change fake-success to a clear "not configured" state (server code, money-adjacent).
2. **#2 Scraper model name** — make the model configurable and fail loudly (server code).
3. **#3 Mock-lesson fallback** — remove or loudly label the mock template path; add an alert when keys are missing (server code, AI path).
4. **#4 Payments "Demo Mode" notes** — audit and clean up so live vs. demo paths are unmistakable (payments).

5. **#5 Embeddings silent-off flag** — surface it (log/alert/health check) and auto-retry (server code).
6. **#6 SIS providers** — either build the next provider or remove the "Coming Soon" entries server-side (integrations).
7. **#9 Parent Portal server checks** — verify/tighten parent↔student authorization (auth/permissions).
8. **#10 Moderation queue expansion** — backend + admin UI (server code).
9. **#12 Matriculation** — decide to finish (needs backend + frontend) or remove the dangling endpoint (server code).

Reminder: every one of these requires the guardrail pause (developer confirmation) before work starts, per `replit.md`.

Any team member (visual/text changes in the app's frontend, or pure content)

In priority order:

1. **#7 "Not yet verified by LYS" wording** — the *label text* can be softened by anyone (e.g., "Alignment under review"); building an actual verification workflow would be developer work.
2. **#8 Post-secondary "Coming Soon"** — if the decision is to hide it rather than build it, removing the menu entry is a frontend text/option change.
3. **#6 (UI half) SIS "Coming Soon" tiles** — hiding the four fake providers from the integrations screen is a frontend-only change (the server half stays developer work).
4. **#11 Team Hub OKRs content** — writing the actual OKR content is a content task for HR/leadership; an admin can enter it through the Team Hub editing screens.
5. **#13 Analytics expectations** — until dashboards exist, updating sales/marketing copy to describe "weekly emailed reports" accurately is a content task.

Prepared automatically from a full scan of the codebase (frontend pages, backend routes, and services). Items already tracked in the project task list or `threat_model.md` were intentionally left out.

CLASSROOM LAYER (Educators + Campus Admins)

1. Campus Admin cannot view teacher gradebooks — biggest broken connection

The Classroom page has an "organization mode" that lets a campus admin see all classes across their campus. But the Gradebook page only ever calls `/api/classes` — the endpoint that returns **the logged-in user's own classes only**. There is no teacher-switcher, no org selector, and no campus admin view in Gradebook.

So: a campus admin can see a list of all classes on campus, but **cannot open any of their teachers' gradebooks from the Gradebook page**.

Recommendations:

1. Add the same "organization mode" switcher that Classroom.tsx has into Gradebook.tsx — pull from `/api/orgs/:id/classes?hierarchy=true` when the user is `campus_admin` or above, and let them pick a teacher's class to view.
2. From the Classroom page's org view, add a direct "View Gradebook" action button on each class card — it already knows the classId, so it can route there directly with the right context.

3. (Lower priority) Add a "Campus Gradebook" summary view that shows each teacher's class averages at a glance before drilling in.
4. Also, a campus admin should be able to access individual classroom analytics same as the educator. But they should also get a school-wide view.

2. Campus admin gradebook export is blocked

The grade CSV export endpoint (`/api/classes/:classId/grades/export`) checks for `isOwner` OR `site_admin`. A `campus_admin` falls into neither bucket — so even if they could navigate to a teacher's gradebook, they couldn't export it.

Recommendations:

1. Extend the export ownership check to also accept `campus_admin` when the class belongs to their organization (the hierarchy check already exists in storage — it just isn't wired here).
2. Add a "Campus Export" option that lets campus admins download all grades across their campus in a single CSV (by school, then teacher, then class).
3. Log all campus admin grade exports to the audit trail (same as `site_admin` currently does) for FERPA compliance.

3. Assessments page is effectively a dead end

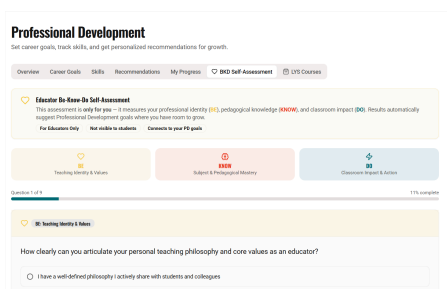

The storage methods for assessments (`getAssessments`, `getAssessment`) currently return empty — they're noted in the code as "in memory for now." The Assessments page is in the sidebar, teachers can navigate to it, but there's likely nothing there to interact with in a meaningful way.

Recommendations:

1. Either wire the assessments storage to the database and flesh out the CRUD flows — or temporarily hide the Assessments sidebar item and replace it with a clear "Coming Soon" state so teachers don't land on an empty page.
2. Clarify how Assessments is meant to differ from Assignments (both seem to handle quizzes/rubrics) — there may be a product definition gap driving the tech gap.

Definition of assessments: A formal or informal gathering of knowledge to show competence in a topic or lesson.

There seems to be confusion on the assessment for the teacher that is a Being, Knowing, Doing assessment. This is a professional assessment for the educator to determine their teaching style as it relates to being, knowing, doing and how that impacts how they teach the student.

VS

Assessment as a check-on-learning tool that an educator uses for a student. There should be a graded assessment, such as a rubric or a formal or informal evaluation similar to an assignment but not the same. At times, an educator may want to give an assessment as an exit ticket to check for understanding instead of or along with an assignment. So this assessment must align with the essential question of the lesson, but be flexible and light weight as not to “create learning”.

- 3. If it is a student Assessment it can live in the assignments home as a drop-down for rubrics and formal evaluations, migrate the `assessment_results` schema rows already in the DB into a working UI.

BE Phase

4. Campus admin signup is a dead end — no path to get linked to a school

When someone picks "School or district administrator" during signup, they're told to sign up as an educator and contact the LYS team. They then land in a full educator dashboard with zero indication of what to do next or how to escalate their account. There is no "Request Admin Access" button, no "Find My School" search, and no in-app way to get elevated.

Recommendations:

1. Add a post-onboarding "Request Campus Admin Access" card on the educator dashboard that appears when the user initially selected the admin path — it should let them enter their school name/district and submit a request that goes to `site_admin` for approval (similar to the Team Hub access request pattern that already exists in the platform).
2. Allow campus admins to be invited by their district admin or site admin via a dedicated invite link that bypasses self-serve onboarding and pre-assigns their org and role.
3. Add a visible "Your account is pending elevation" status message rather than silently dropping them into an educator dashboard with no context.

5. Educator onboarding grade selections don't carry into the Classroom

During onboarding, teachers pick their grade levels, subjects, and grade bands. None of that feeds into the Classroom page — they start with a completely empty classroom and have to re-enter the same grade level and subject info when creating each class manually.

Recommendations:

1. Use the onboarding `gradeLevels/gradeBands` stored in `userPreferences` to pre-populate the "New Class" form defaults (subject, grade level) so teachers don't re-enter what they already told the app.
2. Prompt the teacher with a "Set up your first class" nudge card on their first Classroom visit — pre-filling from their onboarding answers — rather than showing a blank slate.
3. (*Longer term*) If an SIS is connected, auto-import class rosters at the end of onboarding instead of requiring a separate SIS setup flow. If the connection fails, the system admin and campus admin should be flagged and notified.

LEARNER LAYER (Students + Homeschool Parents)

6. Student assignment submission flow — likely a dead end for most students

Students can see their assignments with status cards (Not Started, In Progress, Submitted, Graded), but the actual submission experience — typing a response, uploading work, or marking something complete — is not clearly confirmed to exist. The backend has `assignment_recipients` with status tracking, but there's no confirmed submission form in the student-facing UI.

Recommendations:

1. Audit each assignment type (Quiz, Worksheet, Reflection, Project, Discussion) and confirm whether a student-facing submission form exists for each — if not, build it starting with the most common type (Quiz/Reflection).
 2. Add a clear "Submit Work" button on each assignment card that opens a form appropriate to the assignment type, with a submission confirmation and status update to "Submitted."
 3. After submission, send a notification (in-app and optionally email) to the assigning teacher so they know work is ready to grade — this closes the loop between student submission and educator grading.
 4. Ensure that student submission flow works for both a homeschool parent (educator) and a classroom teacher.
-

7. Homeschool parent can't link their own child — school dropdown blocks them

The parent portal offers two ways to connect to a student: (a) student sends an email invite, or (b) parent searches by school + student ID. For homeschool families, neither path works cleanly — their student has no school to select in the dropdown for option (b), and option (a) requires the student to already have an account and initiate the process.

Recommendations:

1. Add a third "Homeschool" connection path where the parent enters the student's email address and the platform sends a verification link — no school selection required. This is appropriate because a homeschool parent IS the educator, and the trust relationship is different.
2. During homeschool parent onboarding, add a step that asks "Are you adding a child to your account?" and immediately offers to create or invite a student account linked to them — rather than requiring the parent to discover the parent portal after the fact.
3. Allow homeschool parents to directly create a student sub-account (with COPPA-appropriate consent flow) that is automatically linked to them, since they are both parent and educator.

8. Homeschool Planner and Lesson Generator are completely disconnected

The Homeschool Planner generates a 7-day weekly schedule with daily activities, themes, and materials. The Lesson Generator creates deep 5E-model lesson plans. But there's no bridge between them — a parent can't take a day's activity from the planner and expand it into a full lesson plan, and can't take a finished lesson and add it to a week's plan.

Recommendations:

1. Add an "Expand into Lesson Plan" button on each activity card in the Homeschool Planner that pre-populates the Lesson Generator with the subject, grade level, topic, and learning focus from that activity.
2. Add a "Add to Weekly Plan" action on saved lesson plans that lets parents slot a lesson into a specific day in their planner.
3. A/so, Let parents generate the week's planner and then auto-generate lesson plans for each day in sequence — a "Plan My Week" flow that uses both tools together.

9. Student pre-signup quiz data lost on different device / cleared browser

The student pain-point quiz stores its state in `localStorage` keyed by session. When a student completes the quiz on one device and then signs up on a different device or in a different browser, all of that prefill data is gone — they onboard without their quiz answers and miss the matched feature redirect and the "Picked for You" spotlight card.

Recommendations:

1. When a student submits their quiz email, also store a server-side "pending binding" keyed by email — so when they sign up with that same email from any device, the bind happens server-side rather than requiring `localStorage` to be present.
2. Add a "Complete your profile" prompt after first login for students who don't have bound quiz answers, re-asking the 2-3 pain point questions inline on the dashboard.
3. On the final quiz step (before the email gate), use the fingerprint token (the same one used for trials) as a fallback binding key so cross-device cases that share a browser fingerprint still work.

10. Parent permission toggles don't block the tab until clicked

The parent portal has permission toggles (`viewGoals`, `viewAssignments`, etc.) that a student controls. But the parent dashboard shows all tabs regardless of permissions — the tab labels are visible, and the block only happens when the parent actually opens that tab and hits the 403. It feels like the feature is broken rather than permission-protected.

Recommendations:

1. Conditionally hide (or visually gray out) tabs in the parent dashboard based on the permissions object returned from the API — don't show the "Assignments" tab at all if `viewAssignments` is false.
2. If a permission is off, show a friendly "Your student hasn't shared this section yet" message in place of the tab, rather than letting the parent click in and get an error.
3. Let the student see exactly what their parent can view from their own profile page, with a one-tap toggle for each section, so students understand and can adjust permissions easily.
4. The teacher should be able to allow parents to view their students grades/submissions. Base this rule off of current FERPA/COPPA/EDGAR education laws regarding parents' access to their children's information

DISTRICT ADMIN LAYER

11. District admin "People" view only works if educators have org IDs set

The District Admin page shows People tabs for educators, students, and staff across all campuses. But this relies on each user having an `organizationId` set. Educators who self-onboarded (which is the only self-serve path) have no organization linked. So a district admin looking at their People tab will likely see an empty list even when teachers exist on the platform.

Recommendations:

1. Make the org-linking step explicit: when a campus admin is elevated (by `site_admin`), immediately prompt them to invite or claim their teachers — or auto-match by email domain if the school has a domain requirement configured.
2. Show district admins a "Not yet linked" count alongside their linked counts, so they know there are users who need to be claimed vs. the list being genuinely empty.
3. Add an "Invite to Campus" flow in the district admin People tab that sends an org-linking invitation by email, so district admins can pull existing educators into their hierarchy without `site_admin` involvement.

12. District admin campus list is likely empty with no setup path

The `/district-admin/campuses` page shows child organizations. But adding a campus to a district requires manually creating an `Organization` record with the correct `parentOrgId` — there's no "Add Campus" flow in the district admin UI. The page is either empty or read-only with no way to populate it from within the app.

Recommendations:

1. Add an "Add Campus" button on the Campuses page that lets a district admin create a new campus organization — name, address, and optionally a domain — without needing a `site_admin` to do it in the database.

2. Allow district admins to search for and "claim" an existing school organization into their district (useful when schools were created independently before the district admin account existed).
3. Show a helpful empty state on the Campuses page ("No campuses added yet — here's how to get started") rather than a blank page, so district admins know what they're looking at.

13. District admin has no path to assign campus admins

District admins can assign roles up to `campus_admin`, but the UI to do this lives in the Team Hub, which requires a separate access approval process (staff access request flow). So a district admin trying to set up their campus hierarchy hits a wall: they can't add campuses, and even if they could, they can't assign a campus admin without Team Hub access — which requires `site_admin` approval.

Recommendations:

1. Add a "People" → "Assign Role" action in the District Admin UI itself (not Team Hub) that lets a district admin set `campus_admin` on a user within their org hierarchy — scoped strictly to their org, no Team Hub dependency.
2. Grant district admins automatic read access for their own org's people, gated to role management only (not HR/payroll data).
3. Create a simple "School Setup Checklist" flow that walks a district admin through: add campus → invite campus admin → confirm campus admin is linked — so the full hierarchy can be established without back-and-forth with `site_admin`.

Summary by priority

#	Issue	Layer	Type	Impact
1	Campus admin can't view teacher gradebooks	Classroom	Broken connection	● High
4	Campus admin signup has no follow-up path	Classroom	Dead end	● High
7	Homeschool parent can't link their child	Learner	Dead end	● High
6	Student assignment submission likely missing	Learner	Dead end	● High
11	District People view empty (no org IDs)	District	Broken connection	● High

8	Homeschool Planner ↔ Lesson Generator disconnected	Learner	Broken connection	● Medium
2	Campus admin grade export blocked	Classroom	Permission gap	● Medium
13	District admin can't assign campus admins	District	Dead end	● Medium
3	Assessments page is empty/dead	Classroom	Dead end	● Medium
5	Onboarding grade data doesn't feed Classroom	Classroom	Broken connection	● Low
9	Student quiz data lost across devices	Learner	Broken connection	● Low
10	Parent permission tabs visible but blocked	Learner	Permission gap	● Low
12	District campus list empty, no add-campus UI	District	Dead end	● Low

Want me to start building fixes? If so, let me know which items you want prioritized and I'll pause before touching anything in `server/` or billing to confirm as usual.

Planning next user interaction (6 seconds)

The audit report is complete above. The failed background job was just my deep-dive into student assignment submission — I flagged it as issue #6 based on what I found in the other explorations (status cards exist, confirmed submission form is unconfirmed).

Whenever you're ready, just tell me which items you want to tackle first and I'll get started — pausing before touching server code as usual.
